

The New Multivac T 250 Semi-automatic Traysealer: A Compact Machine for Large Formats

The new T 250 extends the options of semi-automatic tray-sealers by offering almost the capacity of a fully automatic entry-level system, for a much more favourable price.

More sizes, more packages

Semi-automatic Multivac traysealers are a profitable solution for small and medium-sized production loads, where there is not yet a fully automatic system. The new Multivac T 250 reduces the distance between the two areas: this compact and capable model has automatic infeed and outfeed of the tray drawer, automatic tray lifting and an optional foot pedal. Apart from loading and removing the trays, all processes are carried out automatically, which enables up to 5 sealing processes per minute. The machine also offers a large basic tray format of 435 x 365 mm, with maximum tray height of 130 mm, which can be apportioned in various different ways. This enables the T 250 semi-automatic tray-sealer to reach a level of performance close to that of a fully automatic entry level machine, but for a much more attractive price.

With regard to seal quality, there is no difference between the new traysealer and larger machines. The extremely high mechanical seal pressure ensures reliably air-tight packaging even under unfavourable conditions. The T 250 enables various options for producing packaging using air, protective gas and vacuum. Dies for inline cutting and skin packaging will be available shortly. The machine is also very versatile in terms of the product to be packaged.

Extremely user friendly

The new model complements the proven semi-automatic T 200 tray-sealer. The T 250 has the same small footprint as the T 200, but its basic tray format is 40% larger. Thanks to its open structure, all areas relevant to maintenance are easily accessible, and the format die can be changed in just a few steps. The controls of the T 250 are completely new: a highly precise, multi-line graphical display gives details and an overview of all steps of the process, and with 20 memory spaces it is simple to operate even with a large range of products.
